SUMMARY

Applied AI Engineer who designs and ships production-grade multi-agent AI systems – from orchestration architecture to secure execution and deployment. Built an autonomous ML platform with 20+ specialized agents and multi-LLM orchestration that turns natural-language questions into executable ML workflows, earning 2nd place at HackIndia 2026, with research on the underlying agentic architecture accepted at IEEE.

WORK EXPERIENCE

AI Agent Automation Engineer

Jun 2025 – Jul 2025

Chennai, Tamil Nadu, India

Zuntra Digital

- Architected a fallback-resilient automation pipeline (n8n + Make.com) to sustain 70+ production agent workflows beyond platform rate limits – reducing manual operational effort by an estimated 100+ hours/week and cutting execution time by 60–70%.
- Headed a 7-member engineering team – assigning workstreams, reviewing implementations, and coordinating with HR/stakeholders – while owning core architecture: integrating 5+ APIs with conditional logic, structured logging, and human-in-the-loop approval gates for business-critical workflows.

PROJECTS

DataOracle – Agentic AI Platform for Autonomous ML & Predictive Analytics

React, FastAPI, LangChain, Python, Scikit-learn, XGBoost, Supabase, MCP, Multi-LLM | [GitHub](#)

- Architected a dynamic multi-agent orchestration system that converts natural-language business questions into executable ML workflows – routing through intent classification, sandboxed code generation/execution, self-healing retries, and model inference to deliver automated insights.
- Built a stage-wise multi-LLM routing framework, assigning classification, code-generation, and insight tasks to different LLMs by workload type to optimize reasoning quality, latency, and cost.
- Engineered 20+ specialized AI agents and 70+ modular skills with MCP integrations, enabling extensible, enterprise-scale autonomous data science workflows on structured datasets.
- Secured 2nd place (Rs. 15,000 prize) at HackIndia 2026, Open Stack Track, qualifying for the national grand finale.

OPS-Agent – General-Purpose Agentic Automation Platform

Python, LLMs, REST APIs, Tool Orchestration | [GitHub](#)

- Designed an AI planning engine where an LLM determines task strategy while deterministic tools handle execution – automating invoice processing, document validation, and multi-step API workflows with a clean planning/execution separation.
- Built a reliability-first orchestration layer with tool validation, retry logic, structured audit logging, and human-in-the-loop approval gates for failure-tolerant enterprise automation.
- First author, "OPS-AGENT: Intelligent Reasoning-Based Automation for Enterprise Document Processing," accepted at IEEE KALINGACONF 2026.

ACHIEVEMENTS

- Finalist in 10 of 14 hackathons entered (71% conversion rate), with 4 first-place wins – demonstrating consistent competitive performance across enterprise, government, and open-track problem statements.
- Notable wins/finals: SIH internal selection round, TN Police Hackathon (2024 & 2025 finalist), HackIndia 2026 (2nd place, Open Stack Track).

TECHNICAL SKILLS

Agentic AI & LLM Systems: Multi-Agent Orchestration, LangChain, MCP, Multi-LLM Routing, Prompt/Tool Orchestration, RAG

Backend & APIs: Python, Java, FastAPI, Flask, Spring Boot, REST APIs, JPA/Hibernate

ML & Data: Scikit-learn, XGBoost, Feature Engineering, Model Evaluation, Pandas, NumPy

Infra & Tools: PostgreSQL, MySQL, MongoDB, Supabase, Docker, Git/GitHub, n8n, Make.com

EDUCATION

St. Joseph's Institute of Technology

Aug 2023 – May 2027

Bachelor of Technology, Artificial Intelligence and Data Science | CGPA: 8.4

CERTIFICATIONS

NVIDIA – Getting Started with Deep Learning | Oracle Cloud Infrastructure – Certified AI Foundations Associate
